

# Drupal AI Factchecker

Claim-level verification on your own corpus,  
*powered by AMD.*

---

**Team:** Drupal AI Router (Leo Fishman)

**License:** GPL-2.0+, published on [drupal.org](https://drupal.org)

# The Problem

- ✗ Universities pay heavily for plagiarism detection, but these tools detect **copying**, not **falsehood**.
- 🤖 AI-generated essays are completely original text full of fabricated claims.
- 🚫 These hallucinations are entirely invisible to every standard plagiarism scanner.
- ⚠️ Editors and educators lack an in-workflow tool to verify factual accuracy.

# The Insight

## Meet them where they work.

The institutions facing this massive problem—governments and universities—already run Drupal. It powers a massive share of the .edu and .gov web space.

The verification tool should live **where the content lives**, seamlessly integrated, not in yet another disconnected SaaS tab.

# The Product: Native Integrity Suite

---

## 1. Factcheck

Atomic claim extraction triggers evidence retrieval. Yields a per-claim verdict (SUPPORTED / UNSUPPORTED / CONTRADICTED) with a fully auditable confidence score.

## 2. AI Likelihood

Generates a 0–100 score with comprehensive rationale. Framed honestly to users: this is a contextual hint, not definitive mathematical proof.

## 3. Verbatim Plagiarism

Identifies the text's most distinctive sentences and securely searches them as exact phrases across the broader web to detect unoriginal drafting.

# Key Differentiators

---

## Evidence Cascade

The university's OWN indexed corpus is prioritized first, the web second. Verdicts are securely grounded in proprietary institutional knowledge.

## Distrust List

Claims echoed only by known-misinformation domains are marked *tainted*. Misinformation sites asserting a claim actually counts AGAINST it.

## 100% Auditable

Every single model call and routing decision is meticulously logged. No other tool on the market combines transparent logging with local evidence.

# Powered by AMD Instinct

All inference (claim extraction + verdict checking) runs on an **AMD Instinct GPU**: ROCm 7.2 + vLLM 0.16 serving Gemma. Student data never leaves institution-controlled hardware.

rocm-smi execution output

AMD serving endpoint in Drupal

A screenshot of a web application interface showing a table of logged routing decisions. The table has columns for 'Entity type', 'User', 'Scope', and 'Message'. Above the table are filters for 'Operation', 'Entity type', and 'User', along with a 'Reset filters' button. The table contains several rows of data, including entries for 'WebApplication' and 'User' with associated email addresses and scopes. The word 'glasses?' is visible in the lower-left corner of the image area.

| Entity type    | User           | Scope        | Message              |
|----------------|----------------|--------------|----------------------|
| WebApplication | user@email.com | Organization | Revision 2 JLR_Users |
| WebApplication | user@email.com | Development  | The 'Text' 'e1667ea  |
| WebApplication | user@email.com | Development  | The 'Bool' 'e1667ea  |
| User           | user@email.com | Organization | user@em login        |
| User           | user@email.com | Organization | user@em login        |
| User           | user@email.com | Organization | user@em login        |

Logged routing decisions

# Architecture Flow

- **Trigger:** Drupal Node → Content Scan
- **Routing:** `ai_provider_universal` router
- **Processing:** AMD GPU (vLLM/Gemma) for extraction & verdicts
- **Retrieval:** Evidence sourced from Search API vector index (local corpus) with Tavily web fallback
- **Auditing:** Decisions securely logged to audit table

Everything—models, backends, evidence sources—is  
Drupal configuration, not hardcoded logic.

# Real & Ready

-  Built as a real, production-ready open-source module on **drupal.org** (`ai_provider_universal`).
-  Built directly on top of the official Drupal AI ecosystem in collaboration with maintainers.
-  Backed by months of prior foundational work.
-  **The Hackathon Delta:** Adding the critical AMD serving layer and defining the focused university use case.

# Market Opportunity

---

**\$1.2B**

**PLAGIARISM DETECTION  
MARKET**

## Ready for Enterprise Budgets

Universities already allocate massive budgets for content-integrity tooling. This solution seamlessly slots into their existing CMS ecosystem at a fraction of the friction—a simple module install.

Beyond academia, the exact same inference pipeline serves the urgent needs of major newsrooms and government content teams.

# Claim-level truth.

Where the content lives, on **AMD**.
